Lack of an effective appointment system is considered as the cause. In this study, a discrete event simulation model was developed to evaluate an appointment system. The developed system considered appointment rule, sequencing rule and environmental factor (priority rule). Various appointment systems were examined by the simulation model.

Designing An Appointment System For An Outpatient Department

In this paper, we consider designing an Appointment System (AS) for an outpatient department of a health care center. Waiting in the line to get consultation from a physician is a major issue in the outpatient clinics, however, minimizing the waiting time would conflict with the number of patients seen by the physician.

Therefore, there should be a balance between the objectives of minimizing

Outpatient scheduling plays a key role in matching the healthcare provider capacity to patient demand and improving clinic performance measures, such as patient waiting time, patient satisfaction, and resource utilization. In addition to the traditional pre-booked appointments, outpatient hospitals and clinics are also experimenting with same day appointments. Designing a hybrid appointment system (combination of same-day and pre-booked) involves multiple decisions such as determining the appointment types, patient sequence, and appointment time. Further, various factors such as patient flow, demand uncertainty, and patient no-shows (patients who do not arrive for scheduled appointments) must be considered to develop an effective design. Inefficiencies in the

Where To Download Designing An Appointment

appointment system design and patient no-shows cost the U.S. healthcare system more than \$150 billion a year. In addition, they also reduce productivity and timely access to care. Most of the previous work on outpatient appointment systems consider a simplified clinic setting with single phase (one-stop service) and single provider. Further, they rarely consider patients provider preference, patient availability, patient specific no-show rate, uncertainty in patient demand and service times. However, in practice, most outpatient departments have multi-phase settings (e.g., pre-screening, visit nurse, visit doctor, checkout) with multiple providers. A detailed simulation analysis indicated that ignoring the multi-phase nature of patient flow, patients provider preference and

Where To Download Designing An Appointment

patients availability lead to unmet demand, patient dissatisfaction and inefficient resource utilization. Further, the associated uncertainties complicate the task of designing the appointment system. This research focuses on designing a data-driven multi-phase multi-provider appointment system for outpatient clinics with the objective of improving resource utilization and patient satisfaction. First, a new approach to design a hybrid appointment system, a combination of pre-booking and open access (same day) appointment types, is proposed. The objective is to determine the schedule configuration of a hybrid appointment system under uncertainty for a multi-phase multi-provider clinic that incorporates patients provider preference and availability. A mathematical

Where To Download Designing An Appointment

programming model is proposed to determine the optimal percentage of appointments reserved for pre-booking and open access, and a scenario-based Monte Carlo approach is used to account for uncertainty. Finally, heuristics are developed to determine the best configuration for the hybrid appointment system. Next, a new framework for sequentially scheduling patients is proposed by using a combination of data analytics and simulation. In the proposed framework, patient-related data from various sources are used to develop predictive models to identify the risk of patient no-show. Finally, different scheduling rules that leverage the patient specific no-show risk are proposed. Their effectiveness is evaluated with respect to current scheduling practices. The results indicate that the proposed rules

Where To Download Designing An Appointment System For An Outpatient Department

consistently outperform the current practice for all the clinic settings tested. A case study with real data from a Family Medicine Clinic in Pennsylvania is used to show the feasibility and applicability of the proposed models. The analysis of the results provided several key insights in designing an appointment system, which are applicable to both researchers and practitioners. Further, the proposed approaches are generic and can be adopted by any outpatient clinic by incorporating their clinic parameters, such as operating hours, slot duration and others.

This proceedings volume contains selected papers presented at the 2014 International Conference on Information Engineering and Education Science (ICIEES 2014),

held June 12-13 in Hong Kong, China.

The objective of ICIEES 2014 was to provide a platform for researchers, engineers, academics as well as industry professionals from all over the world to

This edited volume captures and communicates the best thinking on how to improve healthcare by improving the delivery of services -- providing care when and where it is needed most -- through application of state-of-the-art scheduling systems. Over 12 chapters, the authors cover aspects of setting appointments, allocating healthcare resources, and planning to ensure that capacity matches needs for care. A central theme of the book is increasing

Where To Download Designing An Appointment

healthcare efficiency so that both the cost of care is reduced and more patients have access to care. This can be accomplished through reduction of idle time, lessening the time needed to provide services and matching resources to the needs where they can have the greatest possible impact on health. Within their chapters, authors address: (1) Use of scheduling to improve healthcare efficiency. (2) Objectives, constraints and mathematical formulations. (3) Key methods and techniques for creating schedules. (4) Recent developments that improve the available problem solving methods. (5) Actual applications, demonstrating how the methods can be used. (6) Future directions in which the field of research is heading. Collectively, the chapters provide a comprehensive state-of-the-

Where To Download Designing An Appointment System For An Outpatient Department

art review of models and methods for scheduling the delivery of patient care for all parts of the healthcare system. Chapter topics include setting appointments for ambulatory care and outpatient procedures, surgical scheduling, nurse scheduling, bed management and allocation, medical supply logistics and routing and scheduling for home healthcare.

This fifth edition continues to build upon previous issues with it hands-on approach to systems analysis and design with an even more in-depth focus on the core set of skills that all analysts must possess. Dennis continues to capture the experience of developing and analysing systems in a way that readers can understand and apply and develop a rich foundation of skills as a systems analyst.

This edited volume focuses on research conducted in the area of healthcare systems management. Chapters are extensions of works presented at the International Conference on Management of Ergonomic Design, Industrial Safety and Healthcare Systems. The book addresses the need to have the knowledge of technological and resource management, clinical performances and quality of healthcare delivery systems in order to make hospital systems well and adequately designed and operationally effective ensuring the quality of healthcare to patients. It is a useful resource for students, researchers, industrial professionals and design engineers.

Design and Analysis of Integrated Manufacturing Systems is a fresh look at manufacturing from a systems point of view. This collection of papers from a symposium sponsored by the National Academy of Engineering explores the need for new technologies, the more effective use of new tools of analysis, and the improved integration of all elements of manufacturing operations, including machines, information, and humans. It is one of the few volumes to include detailed proposals for research that match the needs of industry.
