Johannes Vermeer (16321675) has been one of the most widely admired European painters since his so-called rediscovery in the second half of the nineteenth century. Until quite recently, the Romantic roots of writing on the Sphinx of Delft have encouraged the image of him as an isolated genius; the artists private life and religion, his supposed use of a camera obscura, and the fact that his teacher has not been identified have all contributed to an air of mystery. As this new monograph demonstrates, Vermeers life is actually well documented and his work may be more appropriately understood by placing the painter in the context of the Delft school as a whole and of Delft society. The fact that one local patron acquired about twenty pictures by the artist (only thirty-six are known today) must have been significant for Vermeers subtleties of meaning and refinements of technique and style. In the end, however, the most historical approach to Vermeer still leaves us with a master whose rare sensibility and extraordinary powers of observation may be described but not explained.

Since the early 1990s, feminists in India have been rallying against integrating the Indian economy into the world market, perceiving it as a phenomenon which will lead to increased feminisation of poverty and the commodification of women. This anthology explores the impact of globalisation on Indian women and the struggle for gender equality. Since urban India has taken the initial benefit and brunt of globalisation, the focus here is on urban women, particularly from the educated middle class. The two dozen essays in this book offer insights into: - gender identity, gender relations and conceptions of women - violence against women and conflict resolution - women and the media - neo-liberal globalisation, from beauty pageants to working conditions and communication technologies - politics and women political participation \( \text{ Women} \) work is never done, said an African women's rights activist, Feminists work will never ever be done. This book reminds us that the road to the complete empowerment of women in India is still a long one.

Vibration Problems in Machines explains how to infer information about the internal operations of rotating machine from external measurements through methods used to resolve practical plant problems. Second edition includes summary of instrumentation, methods for establishing machine rundown data, relationship between the rundown curves and the ideal frequency response function. The section on balancing has been expanded and examples are given on the strategies for balancing a rotor with a bend, with new section on instabilities. It includes case studies with real plant data, MATLAB® scripts and functions for the modelling and analysis of rotating machines.

Written by a highly regarded author with industrial and academic experience, this new edition of an established bestselling book provides practical guidance for students, researchers, and those in chemical engineering. The book includes a new section on sustainable energy, with sections on carbon capture and sequestration, as a result of increasing environmental awareness; and a companion website that includes problems, worked solutions, and Excel spreadsheets to enable students to carry out complex calculations.

As in most areas of science and engineering, the most important and useful theories are the ones that capture the essence, and therefore the beauty, of physical phenomena. This is true of signals and systems. Signals and Systems: Analysis Using Transform Methods and MATLAB captures the mathematical beauty of signals and systems and offers a student-centered, pedagogically driven approach. The author has a clear understanding of the issues students face in learning the material and does a superior job of addressing these issues. The book is intended to cover a one-semester sequence in Signals and Systems for juniors in engineering. This text is created in modular format, so instructors can select chapters within the framework that they teach this course.

The author provides clear, step-by-step instructions for and expedient 9mm submachine gun. It is easily constructed from readily available materials, primarily steel tubing; it does not require a lathe and milling machine and it can be built by just about anyone in about a week.
