in features, it allows third-party software vendors to develop applications that take advantage of the security infrastructures offered by the engine. Intel's security and management engine is technologically unique and significant, but is largely unknown to many members of the tech communities who could potentially benefit from it. Platform Embedded Security Technology Revealed reveals technical details of the engine. The engine provides a new way for the computer security industry to resolve critical problems resulting from booming mobile technologies, such as increasing threats against confidentiality and privacy. This book describes how this advanced level of protection is made possible by the engine, how it can improve users' security experience, and how third-party vendors can make use of it. It's written for computer security professionals and researchers; embedded system engineers; and software engineers and vendors who are interested in developing new security applications on top of Intel's security and management engine. It's also written for advanced users who are interested in understanding how the security features of Intel's platforms work.

United States. The workshop was held in Halifax, Nova Scotia, Canada, from July 23 through July 27, 1989. This document reports the activities, observations, recommendations and conclusions resulting from FM89.

- 1 Purpose of Workshop The primary purpose for holding FM89 was to assess the role of formal methods in the development and fielding of trustworthy critical systems. The need for this assessment was predicated upon four observations:
 1. Critical systems are increasingly being controlled by computer systems;
 2. Existing techniques for developing, assuring and certifying computer-based critical systems are inadequate;
 3. Formal methods have the potential for playing the same role in the development of computer-based systems as applied mathematics does for other engineering disciplines; and
 4. Formal methods have had limited impact on the development of computer-based systems and supporting technologies.

The goal of the workshop was to complete the following tasks:

1. Assess the problems retarding the development of trustworthy critical systems;
2. Determine the (potential) impact of applying formal methods techniques to the development of trustworthy critical systems;
3. Determine the research and development required to facilitate a broader application of formal methods techniques;
- 4.
