A stirring and sobering diagnosis of the challenges that confront anyone laboring to renew America ' s tradition of ordered liberty. Classicist Bruce Thornton ' s Plagues of the Mind is a forceful vindication of the West ' s tradition of rational, critical inquiry—a legacy now largely jettisoned in favor of a host of new deities, environmentalism, feminism, primitivism, New Age, and the cult of the therapeutic among them.

Why do we find polar bears only in the Arctic and penguins only in the Antarctic? Why do oceanic islands often have many types of birds but no large native mammals? As Charles Darwin and Alfred Russel Wallace travelled across distant lands studying the wildlife they both noticed that the distribution of plants and animals formed striking patterns - patterns that held strong clues to the past of the planet. The study of the spatial distribution of living things is known as biogeography. It is a field that could be said to have begun with Darwin and Wallace. In this lively book, Denis McCarthy tells the story of biogeography, from the 19th century to its growth into a major field of interdisciplinary research in the present day. It is a story that encompasses two great, insightful theories that were to provide the explanations to the strange patterns of life across the world - evolution, and plate tectonics. We find animals and plants where we do because, over time, the continents have moved, separating and coalescing in a long, slow dance; because sea levels have risen, cutting off one bit of land from another, and fallen, creating land bridges; because new and barren volcanic islands have risen up from the sea; and because animals and plants vary greatly in their ability to travel, and separation has caused the formation of new species. The story of biogeography is the story of how life has responded and has in turn altered the ever changing Earth. It is a narrative that includes many fascinating tales - of pygmy mammoths and elephant birds; of changing landscapes; of radical ideas by bold young scientists first dismissed and later, with vastly growing evidence, widely accepted. The story is not yet done: there are still questions to be answered and biogeography is a lively area of research and debate. But our view of the planet has been changed profoundly by biogeography and its related fields: the emerging understanding is of a deeply interconnected system in which life and physical forces interact dynamically in space and time.

This book describes the outstanding features of the ecology and bio geography of the Indian region, comprising former British India, Nepal, Bhutan, Ceylon and Burma. It summarizes the results of nearly four decades' studies and field explorations and discussions with students on the distribution of plants and animals, practically throughout this vast area and on the underlying factors. A number of specialists in geology, meteorology, botany, zoology, ecology and anthropology have also actively collaborated with me and have contributed valuable chapters in their respective fields. India has an exceptionally rich and highly diversified flora and fauna, exhibiting complex composition, character and affinities. Although the fauna of the Indian region as a whole is less completely known than its flora, we are nevertheless fairly well acquainted with at least the salient features of its faunal characters to enable us to present a meaningful discussion on some of the outstanding peculiarities of the biogeography of India. A general synthesis of the available, though much scattered, information should prove useful to future students of biogeography throughout the world.

14 species summaries, 12 contributed papers and 5 rapporteurs' reports on fur seals throughout the world including the Pribilof Islands and Antarctica.

Based on more than twenty years worth of study and data on the Savannah River Plant, a nuclear facility in the Upper Coastal Plain of South Carolina, the contents of this volume encompass the entire spectrum of slider biology, from fossil history and slider systematics to population genetics and parasitology. Annotation copyrighted by Book News, Inc., Portland, OR

With their remarkable electoral successes, Green parties worldwide seized the political imagination of friends and foes alike. Mainstream politicians busily disparage them and imitate them in turn. This new book shows that 'greens' deserve to be taken more seriously than that. This is the first full-length philosophical discussion of the green political programme. Goodin shows that green public policy proposals are unified by a single, coherent moral vision - a 'green theory of value' - that is largely independent of the 'green theory of agency' dictating green political mechanisms, strategies and tactics on the one hand, and personal lifestyle recommendations on the other. The upshot is that we demand that politicians implement green public policies, and implement them completely, without committing ourselves to the other often more eccentric aspects of green doctrine that threaten to alienate so many potential supporters.

"This book takes an analytical approach to world history. Instead of proceeding through history descriptively, it looks at several major questions and ideas, such as the role of technology, the development of universal religions, global trade, or participatory politics. If this sounds thematic, it is. But it also progresses chronologically, analyzing these themes as they apply in certain eras. We use both primary sources in-text, and the latest scholarship as secondary source. These we use frequently in each chapter both to employ the voices of scholars where they say things better than we could, and footnote them for students' reference. We also hope to convey the sense that all this content is part of an ongoing debate amongst historians--and scholars from different disciplines. Finally we attempt to keep the text accessible by focusing on narrative elements of history, and keeping in mind that the readers are undergraduates, often with little exposure to the subject matter. However, the level of ideasremains high"--Provided by publisher.

The cougar is one of the most beautiful, enigmatic, and majestic animals in the Americas. Eliciting reverence for its grace and independent nature, it also triggers fear when it comes into contact with people, pets, and livestock or competes for hunters ' game. Mystery, myth, and misunderstanding surround this remarkable creature. The cougar ' s range once extended from northern Canada to the tip of South America, and from the Pacific to the Atlantic, making it the most widespread animal in the western hemisphere. But overhunting and loss of habitat vastly reduced cougar numbers by the early twentieth century across much of its historical range, and today the cougar faces numerous threats as burgeoning human development encroaches on its remaining habitat. When Maurice Hornocker began the first long-term study of cougars in the Idaho wilderness in 1964, little was known about this large cat. Its secretive nature and rarity in the landscape made it difficult to study. But his groundbreaking research yielded major insights and was the prelude to further research on this controversial species. The capstone to Hornocker ' s long career studying big cats, Cougar is a powerful and practical resource for scientists, conservationists, and anyone with an interest in large carnivores. He and conservationist Sharon Negri bring together the diverse perspectives of twenty-two distinguished scientists to provide the fullest account of the cougar ' s ecology, behavior, and genetics, its role as a top predator, and its conservation needs. This compilation of recent findings, stunning photographs, and firsthand accounts of field research unravels the mysteries of this magnificent animal and emphasizes its importance in healthy ecosystem processes and in our lives.

A diverse set of contributions to the expanding field of ecocritical studies Seeking a broad reexamination of visual culture through the lenses of ecocriticism, environmental justice, and animal studies, this compendium offers a diverse range of art-historical criticism formulated within an ecological context. Picture Ecology brings together scholars whose contributions extend chronologically and geographically from eleventh-century Chinese painting to contemporary photography of California wildfires. The book ' s fifteen interdisciplinary essays provide a dynamic, cross-cultural approach to an increasingly vital area of study, emphasizing the environmental dimensions inherent in the content and materials of aesthetic objects. Picture Ecology provides valuable new approaches for considering works of art in ways that are timely, intellectually stimulating, and universally significant. With contributions by Alan C. Braddock, Maura Coughlin, Rachael Z. DeLue, T. J. Demos, Mónica Domínguez Torres, Finis Dunaway, Stephen F. Eisenman, Emily Gephart, De-nin D. Lee, Gregory Levine, Anne McClintock, James Nisbet, Andrew Patrizio, Sugata Ray, and Greg M. Thomas.

Readers will find new insight into the lives of the world's horses, zebras, and asses, understand the basis of our relationships with these animals, and develop a greater understanding of where equids come from and why they are worth conserving.Included in this book are detailed, state-of-the-science syntheses on Social structure, behavior, and cognition Habitat and diet Ecological niches Population dynamics Roles of humans in horse distribution through time Human dimensions and the meaning of wild Management of free-roaming horses Captive breeding of wild equids Conservation of wild equids Conservation of migrations Reintroductions Genetics and paleogenetics
