Bleeding Kansas, Bloody Kansas, or the Border War was a series of violent civil confrontations in Kansas Territory, United States, between 1854 and 1859 which emerged from a political and ideological debate over the legality of slavery in the proposed state of Kansas. The conflict was characterized by years of electoral fraud, raids, assaults, and murders carried out in Kansas and neighboring ...

This edition updates benchmarks, includes a new chapter on rhetoric, updated a few examples, and thoroughly updated the bibliography.

Does a young person commit suicide every thirteen minutes in the United States? Are four million women really battered to death by their husbands or boyfriends each year? Is methamphetamine our number one drug problem today? Alarming statistics bombard our daily lives, appearing in the news, on the Web, seemingly everywhere. But all too often, even the most respected publications present numbers that are miscalculated, misinterpreted, hyped, or simply misleading. This new edition contains revised benchmark statistics, updated resources, and a new section on the rhetorical uses of statistics, complete with new problems to be spotted and new examples illustrating those problems. Joel Best's best seller exposes questionable uses of statistics and guides the reader toward becoming a more critical, savvy consumer of news, information, and data. Entertaining, informative, and concise, Stat-Spotting takes a commonsense approach to understanding data and doesn't require advanced math or statistics.

At the beginning of the twentieth century, H. G. Wells predicted that statistical thinking would be as necessary for citizenship in a technological world as the ability to read and write. But in the twenty-first

century, we are often overwhelmed by a baffling array of percentages and probabilities as we try to navigate in a world dominated by statistics. Cognitive scientist Gerd Gigerenzer says that because we haven't learned statistical thinking, we don't understand risk and uncertainty. In order to assess risk -- everything from the risk of an automobile accident to the certainty or uncertainty of some common medical screening tests -- we need a basic understanding of statistics. Astonishingly, doctors and lawyers don't understand risk any better than anyone else. Gigerenzer reports a study in which doctors were told the results of breast cancer screenings and then were asked to explain the risks of contracting breast cancer to a woman who received a positive result from a screening. The actual risk was small because the test gives many false positives. But nearly every physician in the study overstated the risk. Yet many people will have to make important health decisions based on such information and the interpretation of that information by their doctors. Gigerenzer explains that a major obstacle to our understanding of numbers is that we live with an illusion of certainty. Many of us believe that HIV tests, DNA fingerprinting, and the growing number of genetic tests are absolutely certain. But even DNA evidence can produce spurious matches. We cling to our illusion of certainty because the medical industry, insurance companies, investment advisers, and election campaigns have become purveyors of certainty, marketing it like a commodity. To avoid confusion, says Gigerenzer, we should rely on more understandable representations of risk, such as absolute risks. For example, it is said that a mammography screening reduces the risk of breast cancer by 25 percent. But in absolute risks, that means that out of every 1,000 women who do not participate in screening, 4 will die; while out of 1,000 women who do, 3 will die. A 25 percent risk reduction sounds much more significant than a benefit that 1 out of 1,000 women will reap. This eye-opening book explains how we can overcome our ignorance of numbers and better understand the risks we may be taking with our money, our health, and our lives.

Here, by popular demand, is the updated edition to Joel Best's classic guide to understanding how numbers can confuse us. In his new afterword, Best uses examples from recent policy debates to reflect on the challenges to improving statistical literacy. Since its publication ten years ago, *Damned Lies and Statistics* has emerged as the go-to handbook for spotting bad statistics and learning to think critically about these influential numbers.

By making introductory statistics interesting through comparing data on today's student generation with their parents' generation, and asking students to consider how people change as they grow older, the book uses data on subjective beliefs (such as freedom of speech and abortion) as well objective characteristics (years of schooling, marital status) to teach basic statistics using SPSS.

Through an examination of people in the workplace, this book offers a look at the four factors that drive human beings and lead them to the choices that they make.

"This book offers an introduction to critical thinking for sociologists. Critical thinking involves the evaluation of arguments. Because sociologists tend to use particular forms of argumentation, it is helpful to consider how such arguments might be evaluated. Taking these matters into consideration can improve sociological arguments"--

sociologist's library. Alan Radley, Emeritus Professor of Social Psychology, Loughborough University *Medicine as Culture* introduces students to a broad range of cross-disciplinary theoretical perspectives, using examples that emphasize bodies and visual images. Lupton's core contrast between lay perspectives on illness and medical power is a useful beginning point for courses teaching health and illness from a socio-cultural perspective. Arthur Frank, Department of Sociology, University of Calgary *Medicine as Culture* is unlike any other sociological text on health and medicine. It combines perspectives drawn from a wide variety of disciplines including sociology, anthropology, social history, cultural geography, and media and cultural studies. The book explores the ways in which medicine and health care are sociocultural constructions, ranging from popular media and elite cultural representations of illness to the power dynamics of the doctor-patient relationship. The Third Edition has been updated to cover new areas of interest, including: - studies of space and place in relation to the body - actor-network theory as it is applied in research related to medicine - The internet and social media and how they contribute to lay health knowledge and patient support - complementary and alternative medicine - obesity and fat politics. Contextualising introductions and discussion points in every chapter makes *Medicine as Culture*, Third Edition a rigorous yet accessible text for students. Deborah Lupton is an independent sociologist and Honorary Associate in the Department of Sociology and Social Policy, University of Sydney.

Stats, stats, stats. It seems everything written about education today is full of stats. With this book, nimble-minded number cruncher and award-winning researcher Gerald Bracey takes your hand and walks you through the process of figuring out the meaning behind the figures. You don't need to be a math whiz to follow Bracey because he writes with clarity and humor, explicitly defining statistical terminology in easy-to-understand language and even offering you thirty-two specific principles for assessing the quality of research as you read it.
